Queue Announcer

Staff guide: how to call out orders at the counter

For version 1.2.1 and later

What it does

You key in the order code from the receipt. The app rings the Foodle bell, then a clear voice reads the code one character at a time, so customers know their food is ready.

WHAT CUSTOMERS HEAR

bell, **"A, 1, 0, 5.** Please collect your order."

"Once again, A, 1, 0, 5."

Before you start

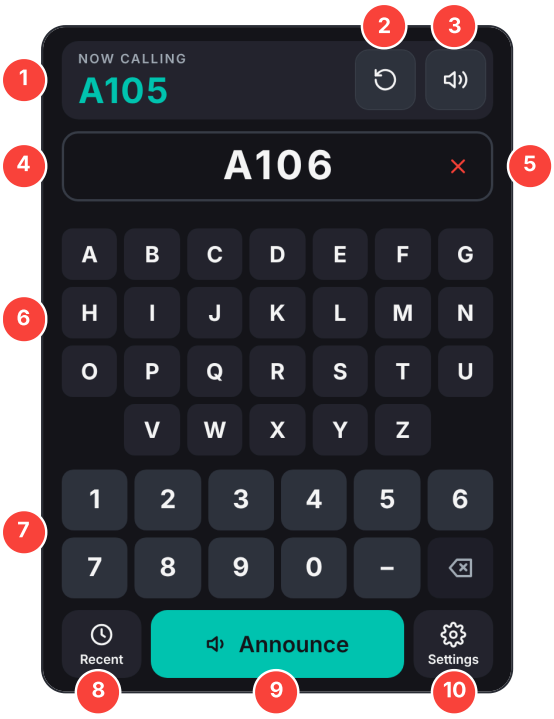

1. Use a computer with **Microsoft Edge**. Edge has the natural voice (Ava) the app is built for.
2. Make sure the speakers are on and loud enough to be heard at the counter.
3. The app needs the internet to start. If the internet drops later, it keeps working.

1 Install it on a PC (one time)

1. Open Edge and go to `https://haikalmhmn.github.io/queue-announcer/`
2. Click the ··· menu at the top right, then **Apps**, then **Install this site as an app**.
3. Click **Install**. A **Queue Announcer** icon with the Foodle logo appears on the desktop and Start menu.
4. From now on, open the app from that icon. You don't need to open Edge first.

Updates are automatic. When the app is improved, every PC gets the new version by itself within about 10 minutes. Nobody needs to reinstall anything.

2 Announce an order

Main screen

1. **Now calling**: the last order announced.
2. **Repeat**: say the last order again.
3. **Mute**: turns all sound off (the icon turns red). Tap again to turn sound back on.
4. **Code display**: shows what you're typing.
5. **× Clear**: wipes the whole code.
6. **Letters** A to Z.
7. **Numbers** 0 to 9, the dash –, and ⌫ to delete the last character.
8. **Recent**: today's called orders, to call one again.
9. **Announce**: calls out the code.
10. **Settings**: sound and app options.

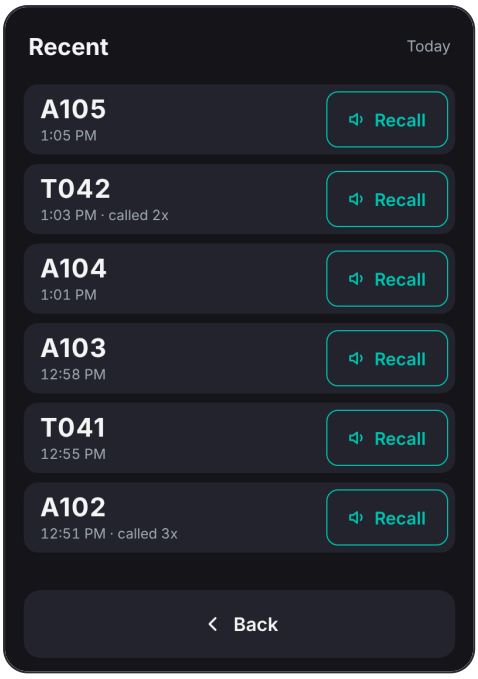

Calling an order

1. Tap the code from the receipt, for example **A 1 0 5**. Codes can be up to 8 characters.
2. Tap **Announce**. The bell rings, then the code is read out twice.
3. Made a mistake? Tap ⌫ to remove the last character, or × to start over.

One call at a time. While a code is being read, the button shows **Speaking… please wait**. You can already type the next code; tap Announce when it turns teal again.

Using a keyboard? Type the code, press `Enter` to announce, `Backspace` to delete, and `Esc` to clear.

3 Call an order again (Recent)

Recent screen

Tap **Recent** at the bottom left of the main screen. It lists every order called today on this PC, newest first, with the time and how many times it was called.

1. Find the order and tap its **Recall** button. The bell and voice play again.
2. While an order is being read, a red **Calling ...** tag shows at the top and the other Recall buttons wait.
3. Tap **Back** at the bottom to return to the keypad.

The list starts fresh each day. Swipe up and down to see older orders.

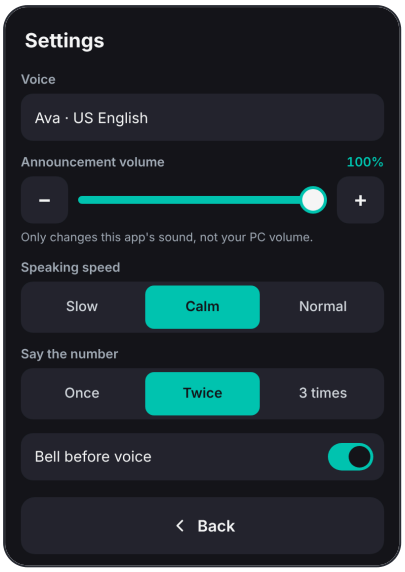

4 The floating window

The first time you tap the app after opening it, the announcer moves into a **small floating window that stays on top of other apps**. You can use the PC for other work and the keypad is always within reach.

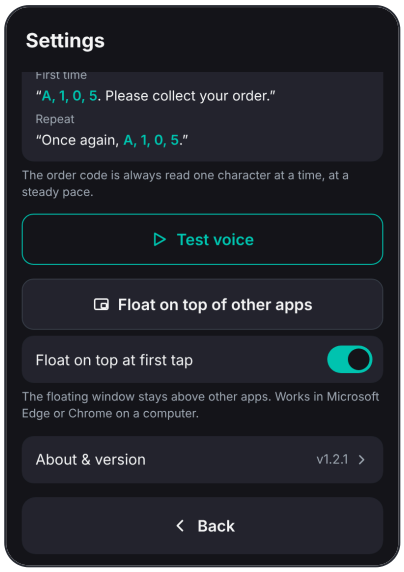

1. The main app window shrinks to a small tab in the **bottom-right corner** showing **Announcer is floating**.
2. Drag the floating window to wherever suits you, for example the **top-right corner**. Edge remembers the spot next time.
3. To bring the announcer back into the main window, tap **Bring it back** on the small tab, or close the floating window.

Don't close the small tab. The floating window belongs to it, so closing it also closes the announcer. You can minimize it with the **–** button instead.

5 Settings

Settings (top)

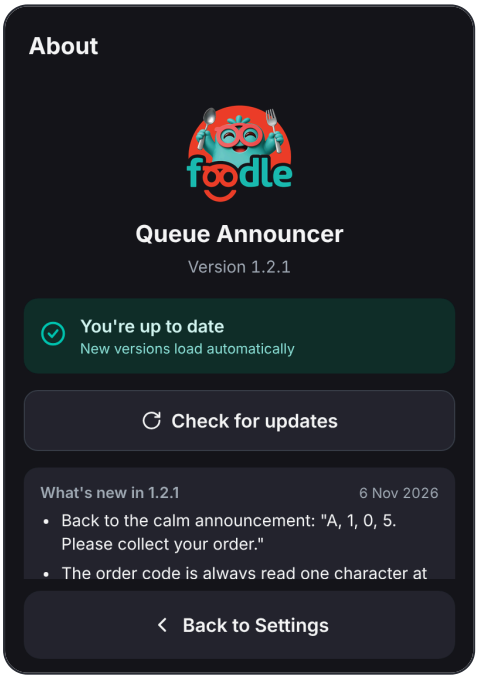

Settings (scroll down)

SETTING	WHAT IT DOES
Voice	Shows the voice in use (Ava). If a PC doesn't have Ava, a similar voice is used and a note suggests updating Edge.
Announcement volume	Makes the bell and voice louder or softer for this app only, not for the whole PC. Use **–** and **+**.
Speaking speed	Slow, Calm or Normal for the words. The order code is always read at the same steady pace.
Say the number	Once, Twice or 3 times.
Bell before voice	Turns the bell on or off. **Bell sound** picks which bell; tap **Test** to hear it.
Test voice	Plays the full announcement so you can check the sound.
Float on top	Opens the floating window by hand. The switch below it controls whether it opens by itself at the first tap.
About & version	Shows the version, whether it's up to date, and what changed in each version.

Each PC remembers its own settings, so a busy counter can be louder than a quiet one.

6 If something goes wrong

PROBLEM	TRY THIS
No sound at all	Check the **Mute** icon on the main screen isn't red. Check **Settings → Announcement volume**. In Windows, right-click the speaker icon, open **Volume mixer**, and make sure **Edge** isn't muted.
"The voice didn't play"	The bell worked but the voice didn't start. Check Edge isn't muted, then tap **Repeat**. If it keeps happening, check the internet connection.
Voice sounds robotic	The app isn't running in Edge, or Edge is out of date. Open it from the Queue Announcer icon and update Edge.
No floating window	It only works in Edge (or Chrome) on a computer. Open **Settings → Float on top of other apps**.
Announcer disappeared	The small tab was probably closed. Open the app again from its desktop icon.
Want the latest version now	Close the app completely and open it again. Check **Settings → About & version**.

About & version

Which version am I on?

Go to **Settings → About & version**. It shows the version number, whether the app is up to date, and a list of what changed. Older versions stay listed underneath, so you can always see the history.

Quick reference

Call an order	Type code → **Announce**
Say it again	**Repeat** (top) or **Recent → Recall**
Silence	**Mute** (top right)
Fix typing	⌫ last character, ✕ all
